Creating Application

Object Types :-

|		
Groups of users represent the different personas who will interact with the application. In Appian, security is assigned to groups.	**Record types** are the primary way to manage data in Appian. Record relationships connect data and help create integrated views of data from different sources.	**Process models** drive actions performed in the application.
Expression rules perform a wide range of functions, including retrieving, formatting, and transforming data.	**Sites** provide a way for users to view and interact with applications.	**Interfaces** are used to build forms, records, sites, and reports. Users can view, add, and modify data through interfaces.

Folders : Appian enables you to create four types of folders: rule, process model, knowledge center, and document.

Knowledge Center : Documents, images, and any other type of file uploaded to an application are stored under the Knowledge Center folder.
